OSCE Executive Committee, Kyushu Dental College

The OSCE Trials at Kyushu Dental College for 86 and 94 of fifth year students were individually performed on March 15 and December 6, 2003. The first trial consisted of 5 stations (medical interview, instruction of tooth brushing, rubberdam dry field technique, alginate impression technique, tooth extraction). The second trial consisted of 7 stations (medical interview, dental X-ray film mount, filling of composite resin, root canal treatment, tooth preparation, explanation of the orthodontic appliance, check the vital sign). The average score was 79.4 point in the first and 80.4 point in the second trails, respectively. The average score in clinical skill was lower than that in the medical interview and explanation of the orthodontic appliance. Also, the average score in clinical skill was affected by place and the order of the examination.
